LAB 5 REPORT

We are going to be looking for differences in the results of two implementations of `MarkdownParse.java` when they run the test files from the `test-files` folder.

These we can compare line-by-line. In fact, there are programs to help us do so! There is a program called diff that is for just the purpose of showing the differences between files.

diff takes two files as arguments and shows their differences in a stylized format I did this on two different implementations that I happened to have checked out (remember, your paths and filenames might be different!) and got this result:

comparing the In lab 9, you experimented with the many tests provided from commonmark-spec. For this lab report, choose any two tests from the 652 commonmark-spec tests where your implementation (or a representative implementation from your group) had different answers than the implementation we provided for lab 9.
We are going to be running more tests against our `MarkdownParse.java` file as well as another student's `MarkdownParse.java` file.
